

## SAP ENABLE

---

SAP Enable extracts accounts receivable documents from SAP R/3 systems and interprets them for use in a trade credit insurance or trade finance environment.

## SAP ENABLE

---

Insurers, funders and program managers rely on the granular visibility of receivable data to structure trade finance deals, efficiently operate trade credit insurance programs and monitor ongoing receivables performance.

Providing detailed accounts receivable data can be a major issue for companies and many struggle to find IT budgets or to allocate the appropriate finance and software development resources required to run what could be an extended IT project.

SAP Enable helps companies automate the extraction and interpretation of accounts receivable data. With minimal IT dependency and no SAP development requirement, SAP Enable usually reduces implementation times from months to a matter of days.

---

## DESIGNED FOR THE TRADE CREDIT & TRADE FINANCE MARKETS

The management of trade credit insurance policies, the operation of modern trade finance programs and the provision of backup servicer facilities all require the regular, daily supply of specific accounts receivable data items.

SAP Enable was built to comply with trade credit insurance and receivables finance data collection requirements. Its auditing and data mapping tools help remove data ambiguity, while minimising non-compliance risk.

SAP Enable can be linked with our Trade Receivables Review to provide an in-depth, automated analysis of current and historic receivables data, or to comply with insurer and funder seller servicer reporting requirements

---

## COMPATIBLE WITH MOST VERSIONS OF SAP ERP

SAP Enable is compatible with most versions and levels of SAP ERP (R/3) and can be configured to support an individual company's use of SAP.

Through a simple setup screen, SAP administrators can quickly configure SAP Enable to export specific data items from specific SAP company ledgers and can set required target file locations and data output formats.

An in-built data auditor quickly identifies which SAP accounting documents are currently in use and our document-mapping tool provides the flexibility to cater for the many different ways that companies use and customise SAP.

---

## NON INVASIVE & READ ONLY

SAP Enable is a non-invasive, read-only data exporter that simply extracts data from standard SAP data tables. It doesn't update any SAP data and SAP administrators control its operation through a single setup screen.

Ensuring data privacy and data security is paramount and SAP Enable was built from the ground-up using ISO 27001:2013 Information Security compliance as its standard.

SAP Enable can be installed and operated in the confidence that it meets today's exacting data security requirements.

---

## LOOKS & FEELS LIKE A SAP PRODUCT

Built by a SAP Gold Partner using native SAP ABAP code, SAP Enable is a self-contained package that looks and feels like any other SAP program.

Presented as a SAP transport and incorporating standard SAP Select functionality, SAP administrators can easily install and manage SAP Enable and create variants to address company specific data export requirements and operational needs.

With emphasis on using standard SAP development and operational practices, SAP administrators can schedule SAP Enable to run when most convenient and output files can be written to specified locations for on-bound transmission.

---

## MINIMAL IT DEPENDENCY

Many businesses struggle to build SAP accounting data exporters that satisfy insurer and funder data requirements. Significant accounting practice knowledge and expensive SAP ABAP software development resources are needed to build a compliant data export-solution.

Finding IT budgets and allocating appropriate finance and software development resources in a timely fashion can often be a challenge.

SAP Enable removes most if not all of these issues. Built using native SAP code, SAP Enable is easily installed & managed by existing SAP administrative staff. With minimal IT dependency and no SAP development requirement, SAP Enable usually reduces implementation times from months to a matter of days.

SAP Enable is part of an integrated suite of Aronova trade finance products, providing end-to-end solutions that redefine how modern-day trade finance programs are implemented, structured and operated.
